• Ethylene is good for: •

PRECISION RIPENING

Climacteric fruit, like apples, mangoes, and bananas, can be harvested before they have reached full ripeness and stored in a controlled environment until they are ready to be ripened.

Once it is time to ripen the fruit, the fruit is exposed to precise amounts of ethylene gas which trigger:

DEGREENING

Green citrus fruits are exposed to low levels of ethylene to remove chlorophyll and enhance coloration

TIP:

Measure ethylene with a handheld gas analyzer to avoid waste! According to postharvest researchers, climacteric fruit will reach full ripeness when exposed to ethylene levels at 10 PPM. Anything above 10 PPM is a waste!

Ŝ

What is ethylene?

Ethylene is an odorless, invisible gas produced by **fruit** when it begins to age. Other sources include exhaust, smoke, and rotting vegetation.

FRESH CUT FLOWERS

in cut flowers, causing:

WILT -

LOSS OF PETALS

BROWNING

TIP:

Keep fresh cut flowers away from your fruit bowl to help them last longer!

Ethylene is **bad** for:

RIPE FRUIT

Ethylene can cause ripe fruit to age more quickly, speeding up spoilage

PLANTS AND CROPS

Some plants and crops that are exposed to ethylene will experience:

YELLOWING

HARM TO BUDS ON DORMANT **NURSERY STOCK**

> **ABSCISSION OF FLOWERS AND LEAVES**
